Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

Claim 1 (amended): Voltage shift control circuit intended to be placed in parallel with at least one voltage shift capacitor (Ca) coupling the phase comparator (10) and the voltage controlled oscillator (30) of a phase locked loop, and comprising:

- an input (21), intended to be coupled with the output of the phase comparator;
- an output (22), intended to be coupled with the input of the voltage controlled oscillator;
- controlled charging means (51), designed to charge the voltage shift capacitor according to a control signal;
- controlled pre-charging means (52), designed to accelerate the charging of the voltage shift capacitor by the controlled charging means; and
- controlled polarization means (53), designed to ensure the polarization of the input during the pre-charging of the voltage shift capacitor.

Claim 2 (amended): Circuit according to Claim 1, characterized in that wherein the controlled charging means comprise a first operational amplifier (OAT1) connected as a voltage follower between the input and the output, a resistor (Ra) placed in the feedback loop of the operational amplifier, and a controlled current source supplying a current (Ia) of specified value through said resistor.

Claim 3 (amended). Circuit according to Claim 2, wherein the operational amplifier of the charging means comprise a push-pull output stage (P1-P2), and wherein the charging means further comprise a resistor (Rb) of high value connected in series between the output of the operational amplifier and the output of the circuit.

Claim 4 (amended). Circuit according to Claim 3, wherein the controlled pre-charging means comprise a push-pull stage (P3-P4) which, in the activation of the pre-charging means configuration, is arranged as a mirror with respect to the push-pull output stage of the operational amplifier of the charging means, in such a way as to short-circuit the high value resistor.

Atty Docket No.: 28944/40163

Claim 5 (original). Circuit according to Claim 4, wherein the push-pull stage of the precharging means is designed to deliver a current higher than the current delivered by the pushpull output stage of the operational amplifier of the charging means.

Claim 6 (amended). Circuit according to any one of the preceding claims Claim 1, wherein the controlled polarization means comprise a second operational amplifier (OTA2) connected as a voltage follower which, in the activation of the controlled polarization means configuration, is arranged to impose a common mode voltage on the input of the circuit.

Claim 7 (amended). Circuit according to any one of the preceding claims Claim 1, further comprising means (54) for deactivating the controlled pre-charging means before the controlled polarization means.

Claim 8 (amended). Circuit according to any one of Claims 2 to 7 Claim 2, further comprising an additional controlled push-pull stage (P5-P6) whose output is intended to be connected to the centre point of an RC network of a loop filter of the PLL and which, in the activation configuration, is connected as a mirror with respect to the push-pull stage of the controlled pre-charging means and with respect to the push-pull output stage of the operational amplifier of the charging means.

Claim 9 (original). Circuit according to Claim 8, wherein the additional controlled pushpull stage is integrated with the operational amplifier of the charging means. Claim 10 (amended). Circuit according to any one of the preceding claims Claim 1, designed in CMOS technology.

Atty Docket No.: 28944/40163

Claim 11 (amended). Phase locked loop comprising a phase or frequency comparator (10), a loop filter (20), a voltage controlled oscillator (30), a voltage shift capacitor (Ca) connecting the phase comparator and the voltage controlled oscillator, and a voltage shift control circuit according to any one of the preceding claims Claim 1 placed in parallel with the voltage shift capacitor and comprising:

- an input, intended to be coupled with the output of the phase comparator;
- an output, intended to be coupled with the input of the voltage controlled oscillator;
- controlled charging means, designed to charge the voltage shift capacitor according to a control signal;
- controlled pre-charging means, designed to accelerate the charging of the voltage shift capacitor by the controlled charging means; and
- controlled polarization means, designed to ensure the polarization of the input during the pre-charging of the voltage shift capacitor.

Claim 12 (amended). Radio-frequency transmitter, eomprising having a phase locked loop according to Claim 11 for generating a radio-frequency signal to be transmitted, said phase locked loop comprising a phase or frequency comparator, a loop filter, a voltage controlled oscillator, a voltage shift capacitor connecting the phase comparator and the voltage controlled oscillator, and a voltage shift control circuit according to Claim 1 placed in parallel with the voltage shift capacitor and comprising:

- an input, intended to be coupled with the output of the phase comparator;
- an output, intended to be coupled with the input of the voltage controlled oscillator;
- controlled charging means, designed to charge the voltage shift capacitor according to a control signal;
- controlled pre-charging means, designed to accelerate the charging of the voltage shift capacitor by the controlled charging means; and
- controlled polarization means, designed to ensure the polarization of the input during the pre-charging of the voltage shift capacitor.

Claim 13 (amended). Mobile terminal of a radio-communications system comprising with a radio-frequency transmitter according to Claim 12 having a phase locked loop for generating a radio-frequency signal to be transmitted, said phase locked loop comprising a phase or frequency comparator, a loop filter, a voltage controlled oscillator, a voltage shift capacitor connecting the phase comparator and the voltage controlled oscillator, and a voltage shift control circuit according to Claim 1 placed in parallel with the voltage shift capacitor and comprising:

Atty Docket No.: 28944/40163

- an input, intended to be coupled with the output of the phase comparator;
- an output, intended to be coupled with the input of the voltage controlled oscillator;
- controlled charging means, designed to charge the voltage shift capacitor according to a control signal;
- controlled pre-charging means, designed to accelerate the charging of the voltage shift capacitor by the controlled charging means; and
- controlled polarization means, designed to ensure the polarization of the input during the pre-charging of the voltage shift capacitor.

Claim 14 (amended). Base station of a radio-communications system emprising with a radio-frequency transmitter according to Claim 12 having a phase locked loop for generating a radio-frequency signal to be transmitted, said phase locked loop comprising a phase or frequency comparator, a loop filter, a voltage controlled oscillator, a voltage shift capacitor connecting the phase comparator and the voltage controlled oscillator, and a voltage shift control circuit according to Claim 1 placed in parallel with the voltage shift capacitor and comprising:

- an input, intended to be coupled with the output of the phase comparator;
- an output, intended to be coupled with the input of the voltage controlled oscillator;
- controlled charging means, designed to charge the voltage shift capacitor according to a control signal;
- controlled pre-charging means, designed to accelerate the charging of the voltage shift capacitor by the controlled charging means; and
- controlled polarization means, designed to ensure the polarization of the input during the pre-charging of the voltage shift capacitor.
